    FileName:
            KDF.h
    Version:
            KDF_V1.1
    Date:
            Sep 24,2016
    Description:
            This headfile provides KDF function needed in SM2 algorithm
    Function List:
        1.SM3_256          //calls SM3_init、SM3_process and SM3_done to calculate hash value
        2.SM3_init         //init the SM3 state
        3.SM3_process      //compress the the first len/64 blocks of the message
        4.SM3_done         //compress the rest message and output the hash value
        5.SM3_compress     //called by SM3_process and SM3_done, compress a single block of message
        6.BiToW            //called by SM3_compress,to calculate W from Bi
        7.WToW1            //called by SM3_compress, calculate W' from W
        8.CF               //called by SM3_compress, to calculate CF function.
        9.BigEndian        //called by SM3_compress and SM3_done.GM/T 0004-2012 requires to use
big-endian.
                           //if CPU uses little-endian, BigEndian function is a necessary call to
change the
                           //little-endian format into big-endian format.
        10.SM3_KDF         //calls SM3_init、SM3_process and SM3_done to generate key stream
    History:
        1. Date:    Sep 18,2016
            Author: Mao Yingying, Huo Lili
            Modification: Adding notes to all the functions
